Wildlife Conservation Values Assessment
South Bay Cove LLC- Conservation Easement Property
North Myrtle Beach, Horry County, SC
18 September 2018
Christopher R. Wilson, Conservation Ecology LLC

This report provides an assessment of the wildlife conservation values of the 27 acre South Bay Cove LLC conservation easement property located near the town of North Myrtle Beach in Horry County, SC. The property is held under conservation easement by North American Land Trust and is managed by EcoVest Capital Inc.

I reviewed existing mapping, species, and habitat data to determine conservation context on the landscape and potential for rare species. I also visited the property on multiple occasions in 2016, 2017, 2018 to perform wildlife surveys on the property, targeting detection of birds and mammals, including bats.

The property is one of four contiguous conservation properties (Cypress Cove, Long Bay Marina, North Bay Cove, and South Bay Cove) totaling 145 acres, which are also held under easement by NALT and managed by EcoVest. Because the wildlife found on any one property are likely to occur on the neighboring properties, and for practical reasons, the wildlife survey results for all four properties are presented together.

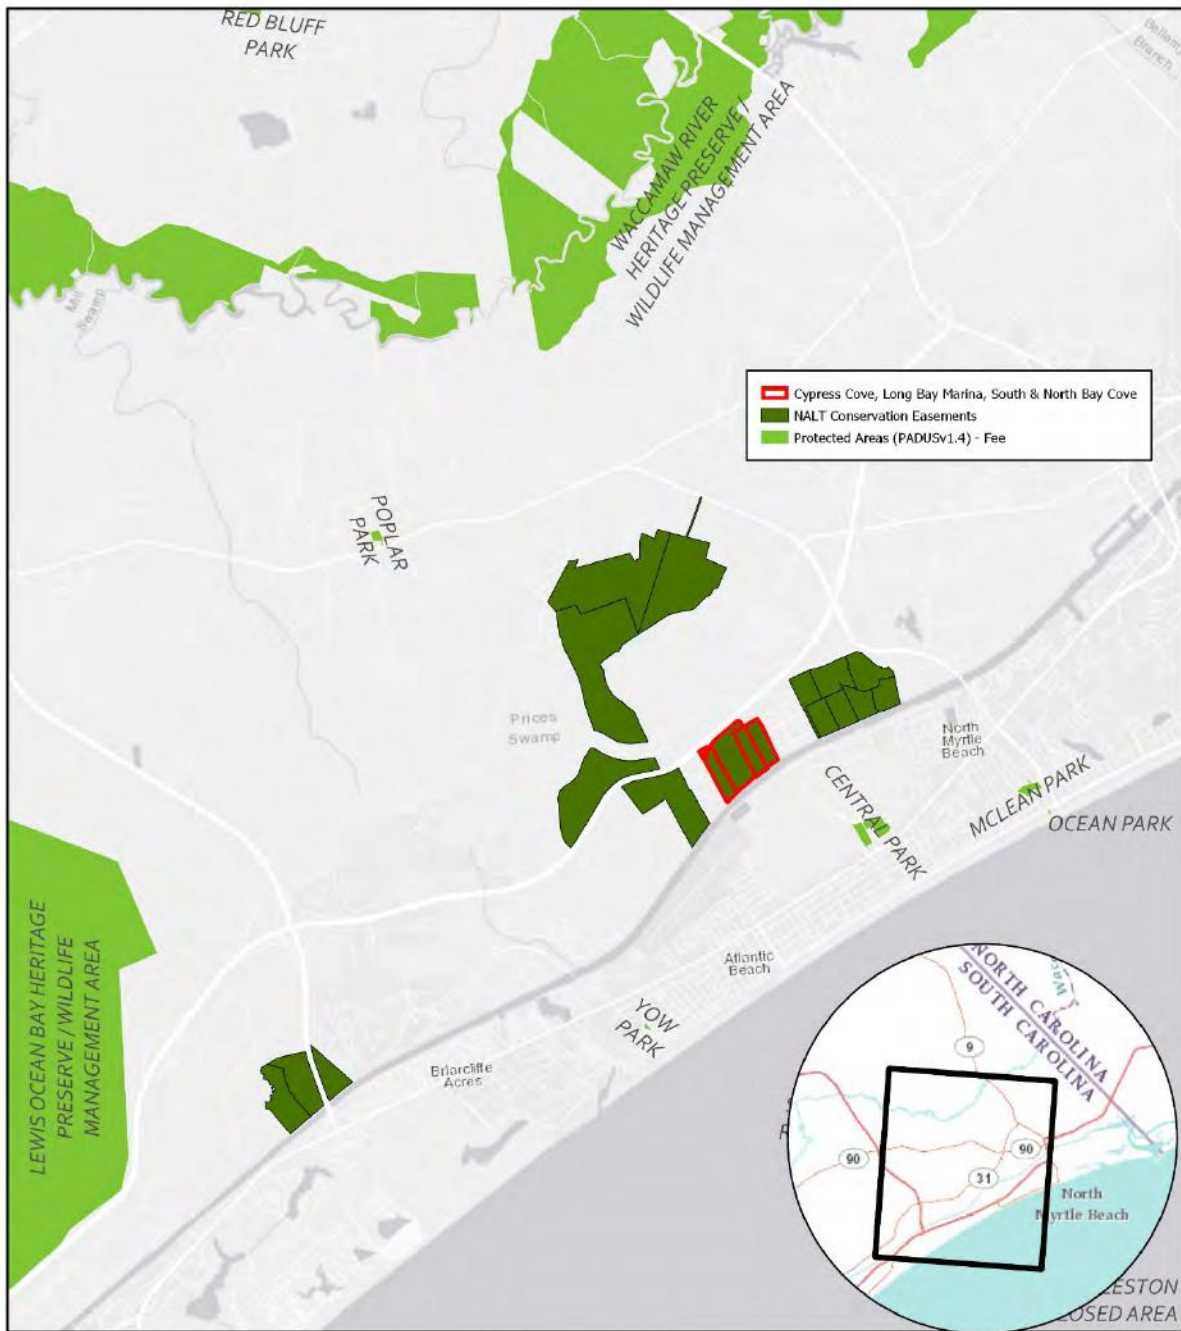

The Cypress Cove, Long Bay Marina, North Bay Cove, and South Bay Cove properties are located in the Southeastern Coastal Plain ecoregion of South Carolina, roughly 1.5 miles from the Atlantic Ocean, and adjacent to the Atlantic Intercoastal Waterway. They are characterized by low elevations (<30") and flat topography. The Cypress Cove property is dominated by young Southern Atlantic Coastal Plain Mesic Hardwood Forest and contains ephemeral pools at the northern end of the property. Long Bay Marina is dominated by Loblolly Pine Plantation forest between 40-60' in height and contains a 1.5 acre meadow in the southwest corner of the property. The northern half of North Bay Cove and South Bay Cove are dominated by Southern Atlantic Coastal Plain Mesic Hardwood Forest that has recently been thinned using mulching machines, leaving a more open understory and scattered mature hardwood trees. The southern half of these two properties contains a large meadow with a forested buffer along the waterway. Vegetation types on the properties are better described in the Baseline Documentation Reports prepared by North American Land Trust.

Conservation Context – Adjacency and proximity to other protected areas helps to minimize habitat fragmentation, enhance ecological connectivity for various species and ecological processes, minimize easement stewardship and defense issues, and is an important conservation attribute recognized by IRS Treasury Regulations 1.170A-14(d)(4)(iv)(4).

Each of the four properties are contiguous with adjacent conservation properties, which together form a 145 acre contiguous conservation block. Protecting natural areas of this size in the highly urbanized Myrtle Beach region is uncommon.

The properties are less than 0.5 miles from, and imbedded within, 1,182 acres of additional conservation lands held by NALT which together form a 1,327 acre cluster of conservation properties collectively referred to as the Sandridge properties.

The Sandridge property cluster, as a whole, is 1.7 miles from the SCDNR-Waccamaw River Heritage Preserve / Wildlife Management Area to the north, 3.4 miles from the 10,427 acre SCDNR-Lewis Ocean Bay Heritage Preserve - Wildlife Management Area & State Natural Heritage Preserve to the west, and 2.7 miles from a 167 acre cluster of NALT conservation lands to the southwest (Belle Harbour Resort, Diamond Grande Resort, and Myrtle Cove).

South Carolina Natural Heritage Trust GIS Database Review - The South Carolina Natural Heritage Trust is part of the South Carolina Department of Natural Resources and serves as an information clearinghouse in support of the conservation of rare plants, animals, and natural communities. Records of rare species are reported voluntarily to the trust by biologists and become part of the database. A lack of records for a property or county does not mean that a particular species does not occur; only that no records have been reported or, more likely, that surveys have not been conducted.

The SCNHT GIS database was queried for records on or near the properties.

- The SCNHT database has no records of rare species occurring on the properties
- 11 rare vertebrate species records occur within the county including: Spotted Turtle, Southern Hognose Snake, Black Bear, Red-cockaded Woodpecker, and Pine snake.

Wildlife Field Surveys 2016 - 2018

Conservation Significance of Observed Species—Federal- and State Threatened and Endangered species are afforded special legal protections from take, harassment, etc, and are used to determine the significance of a property or habitat for regulatory purposes. While important, Threatened & Endangered species lists are not (by themselves) the best references for determining significance for conservation purposes, because they are too limited. Whether or not a species is listed as Threatened or Endangered under State and Federal Endangered Species Acts necessarily involves political considerations and lengthy bureaucracy, and many species are in-fact considered biologically endangered but are not on such lists. Also, when a species is listed as Threatened or Endangered, available options to save it may be severely limited and expensive, or it may be too late.

There are many factors that determine which species should be prioritized for conservation and if we limit ourselves to only acting on those species that are listed Threatened or Endangered, biodiversity will be lost. In response to the need for more robust and proactive methods to determine conservation significance, a number of different species prioritization schemes (besides State and Federal Endangered Species Lists) have been developed in recent decades.

In order to determine the conservation significance of wildlife species found on the properties, I referred to the following conservation plans that assign priority conservation status to wildlife species in the Southeastern Coastal Plain of South Carolina (Bird Conservation Region 27, or “BCR27”). Each of these programs are independent efforts, used different prioritization approaches, and were driven by different organizational objectives and constraints, thus their results will vary. However, each are government supported efforts meant to guide proactive and voluntary biodiversity conservation actions (such as conservation easements) and each should be considered a valid list for determining the significance of species for conservation.

South Carolina’s Comprehensive Wildlife Conservation Strategy (aka. – SC State Wildlife Action Plan, or SC SWAP)

The SC SWAP emphasizes a cooperative, proactive approach to conservation. The charge to state wildlife agencies to develop comprehensive strategies had its origins in the Wildlife Conservation and Recreation Program (WCRP) that was created in the federal Appropriations Act of 2001. Appropriations language provided that funds may be used for “...the planning and implementation of [a state’s] wildlife conservation and restoration program and wildlife conservation strategy, including wildlife conservation, wildlife conservation education, and wildlife-associated recreation projects” (114 STAT. 2762A -118 PUBLIC LAW 106–553 — APPENDIX B — Title IX). The WCRP appropriations language challenged the states to develop projects in the three major areas anticipated in the Teaming with Wildlife initiative: conservation, education, and recreation. WCRP appropriations language also provided that “Within five years of the date of the initial apportionment, [the states shall] develop and begin implementation of a wildlife

conservation strategy based upon the best available and appropriate scientific information and data”.

In the 2015 revision to the SC SWAP, the SCDNR identified 825 species of flora and fauna to include on the State’s List of Species with the Greatest Conservation Need (SGCN, or “priority species”). Expert review helped to identify the current needs of wildlife in the state. These needs translate into conservation actions that can cross multiple scales, with treatments recommended at the species, habitat and regional level. Eight recurring conservation action areas were identified, including: education and outreach; habitat protection; invasive and nonnative species; private land programs; public land management; regulatory actions; survey and research needs; and urban and developing lands. All of South Carolina’s 62 priority actions to address problems and issues fall within these conservation action areas.

The SC SWAP Species of Greatest Conservation Need list was used to assess the conservation priority of wildlife species observed on the property.

<http://dnr.sc.gov/swap/index.html>

The Atlantic Coast Joint Venture - South Atlantic Migratory Bird Initiative (SAMBI) Implementation Plan (2006)

The ACJV is a partnership of federal, regional and state agencies and organizations focused on the conservation of habitat for native bird species in the Atlantic Flyway region of the United States. The joint venture coordinates planning and delivery of bird habitat conservation, resulting in more effective and efficient conservation and the ability to focus limited resources on continental, national, flyway and regional bird conservation priorities. It is administered through the U.S. Fish and Wildlife Service and coordinates much of the science guiding federal grant making for conservation projects (<http://acjv.org/>)

The ACJV-SAMBI Implementation Plan (v3.1, 2006) encompasses the eastern portion of BCR 27, the Southeastern Coastal Plain. The objective of the plan is to integrate the objectives of existing and emerging bird conservation plans into a single plan that land managers, biologists, administrators, and private landowners can use to achieve common goals and objectives for bird conservation across a regional landscape. The plan identifies priority species, priority habitats, priority areas, and strategies to achieve the conservation of “all birds across all habitats” in this region. This plan is a result of the collaboration of federal, state, non-governmental, and private interests to build a cohesive strategy for bird conservation in the southeastern United States.

The Priority Bird Species list for the region is categorized as Highest, High, and Moderate priorities as follows:

- Highest priority species are those of High Continental and/or Regional Concern in need of Immediate Management Attention

- High priority species are species of Continental or Regional Concern in need of Management Attention, and
- Moderate priority species are species where monitoring is needed to ensure population persistence, and which may also include additional Federally endangered species, State listed species, and other species of conservation or management interest.

An important habitat conservation strategy identified in the plan (Strategy B.2.) is the acquisition of conservation easements: “Conservation easements with private landowners and local governments will be used to acquire legal interests to conserve and manage important wetlands and associated upland habitats and limit development while allowing some use by the landowner consistent with the easement conditions.”
http://www.acjv.org/documents/SAMBI_Plan3.2.pdf

US Fish and Wildlife - Birds of Conservation Concern (BCC) 2008 –

“The 1988 amendment to the Fish and Wildlife Conservation Act mandates the U.S. Fish and Wildlife Service (USFWS) to “identify species, subspecies, and populations of all migratory nongame birds that, without additional conservation actions, are likely to become candidates for listing under the Endangered Species Act (ESA) of 1973.” Birds of Conservation Concern 2008 is the most recent effort to carry out this mandate.”

“The overall goal of the Birds of Conservation Concern is to accurately identify the migratory and non-migratory bird species (beyond those already designated as Federally threatened or endangered) that represent the highest conservation priorities.”

The USFWS Birds of Conservation Concern (BCC) list for BCR27 was used to determine the conservation significance of birds observed on the properties.

<https://www.fws.gov/birds/management/managed-species/birds-of-conservation-concern.php>

Breeding Bird Surveys – The diversity and distribution of breeding birds on the properties was sampled using 5-minute point-counts, which entails counting all individual birds heard or visually observed while standing in one location (a point-count station) for 5-minutes. Fifteen point-count stations were sampled throughout the properties during the month of May in 2016, 2017, and 2018. Each point-count location was sampled only once. In addition to point-counts, casual observations of birds were also noted. Results are presented in the tables and maps below.

- 37 bird species were observed across all four properties, 17 of which were identified as conservation priorities (16 SC-SWAP, 11 ACJV, and 1 BCC)
- Priority species were distributed among all four properties:
 - 23 bird species were observed at Cypress Cove, including 12 Priority species (11 SC-SWAP, and 8 ACJV)
 - 24 bird species were observed at Long Bay Marina, including 15 Priority species (14 SC-SWAP, 10 ACJV, and 1 USFWS-BCC)
 - 14 bird species were observed at North Bay Cove, including 6 Priority species (6 SC-SWAP, 3 ACJV, and 1 USFWS-BCC)
 - 29 bird species were observed at South Bay Cove, including 12 Priority species (12 SC-SWAP, 6 ACJV, and 1 USFWS-BCC)

The ten most frequently encountered species across the four properties were: Carolina Wren, Northern Cardinal, Carolina Chickadee, Tufted Titmouse, Pine Warbler, Red-bellied Woodpecker, Painted Bunting, Mourning Dove, Pileated Woodpecker, and Common Grackle.

On July 5, 2016, six Mississippi Kites were observed aerial foraging for dragonflies above the open field at the south end of the North Bay and South Bay properties.

The most notable species breeding on the properties is the Painted Bunting, which is highly ranked by all three conservation plans. There were at least 7 independent observations of singing Painted Buntings on the properties within the breeding season, all within roughly 800 feet of the Intercoastal Waterway along forest edges and in small forest openings.

Painted Buntings breeding in South Carolina belong to the Eastern subspecies, *Passerina ciris ciris* (which may eventually be described as full separate species). During the breeding season, this subspecies is restricted to four states along the Atlantic Coast: North Carolina, South Carolina, Georgia and Florida. South Carolina supports one third to one-half of the total breeding population of the Eastern subspecies. In general, the Painted Bunting utilizes a variety of habitats, primarily forest edge and shrub habitats along the coast. The greatest risk to the eastern population appears to be rapid loss of habitat along the outer Coastal Plain attributed to rapid development and other factors. (Fire Management Species Profile Painted Bunting (*Passerina ciris*), Division of Strategic Resource Management & the Division of Fire Management, USFWS, Southeast Region, Atlanta, GA <https://www.fws.gov/southeast/pdf/fire/painted-bunting-fire-management.pdf> ; William C. Hunter (USFWS) and Dean Demarest (USFWS). Supplemental Volume: Species of Conservation Concern SC SWAP 2015. <http://www.dnr.sc.gov/swap/supplemental/birds/paintedbunting2015.pdf>)

Bat Surveys- Bats were surveyed using Wildlife Acoustics SM2BAT+ and SM4BAT acoustic detectors and SMX-UT and SMM-U1 omnidirectional microphones. The microphones were mounted on 12' high painters-poles and the units were deployed at 6 locations across the properties for a total of 19 detector-nights of sampling effort.

Each recorder unit was placed at the edge of a forest and some kind of opening (meadow, forest road, powerline ROW, etc.) or near pooled water, where feeding bats are likely to concentrate. Acoustic filter settings and programming of the recorders followed the manufacturer's recommendations for USFWS protocol surveys for Indiana Bats (utilizing the 2015 version of the "Indiana.set" file). Wildlife Acoustics Kaleidoscope software (5.0.3) was used to clean the recordings, automatically identify the bat species call, and provide a probabilistic statement about the certainty of the identification. The eastern North America classifiers (4.3.0) were used and were set to +1 More Accurate (the most conservative setting), which minimized false positive identifications. The analysis was limited to bat species identified in the *SC Bat Conservation Plan* (SCDNR 2016) as occurring in the Coastal Zone & Coastal Plain. A probability of false identification value (or p-value) of <0.05 was chosen as a threshold for accepting the species identification and assuming presence on the property.

Bat dectector deployed along edge of field – South Bay Cove property

Over 2,000 individual recordings of bats were collected, indicating significant bat foraging activity on the properties. Of these, 1,093 recordings were assigned to one of ten species by Kaleidoscope Pro. Seven species were identified with a p-value <0.05 . These were: Red Bat, Hoary Bat, Northern Yellow Bat, Silver-haired Bat, Evening Bat, Tri-colored Bat, and Brazilian Free-tailed Bat. Five are considered “Highest Priority” by the SC SWAP. The Tri-colored bat is currently under review for listing under the Federal Endangered Species Act (Endangered and Threatened Wildlife and Plants; 90-Day Findings for Five Species. December 20, 2017. Federal Register Volume 82, Number 243, Pages 60362-60366).

Bat Species Identified by Kaleidoscope Pro (p<0.05)
Cypress Cove/Long Bay/North Bay/South Bay properties

CODE	SCIENTIFIC NAME	COMMON NAME	G-RANK	S-RANK	SC SWAP PRIORITY	Habitat
LABO	<i>Lasiurus borealis</i>	Red Bat	G5	SNR	Highest	thinned stands; roost on smaller branches or twigs, often in the hardwood tree canopy; may roost in leaf litter
LACI	<i>Lasiurus cinereus</i>	Hoary Bat	G5	S?	Highest	tree cavities, trunks, tree foliage, squirrel nests, and Spanish moss
LAIN	<i>Lasiurus intermedius</i>	Northern Yellow Bat	G4/G5	S?	Highest	forage over open areas such as fields, pastures, golf courses, marshes, and along lake and forest edges; roost in clumps of Spanish moss or under old palm fronds
LANO	<i>Lasionycteris noctivagans</i>	Silver-haired Bat	G5	SNR	Highest	roosts include tree cavities, under loose bark, rock crevices, under tree foliage, and occasionally in buildings, stacks of firewood, and bird boxes; forage over water
NYHU	<i>Nycticeius humeralis</i>	Evening Bat	G5			bottomland forests, waterways, Roosts in hollow trees, loose bark, Spanish moss, under palm fronds, in buildings/ attics
PESU	<i>Perimyotis subflavus</i>	Tri-colored Bat	G5	SNR	Highest	abandoned mines and caves, bridges, buildings
TABR	<i>Tadarida brasiliensis</i>	Brazilian Free-tailed Bat	G5			Use wide variety of foraging habitats. Day roosts: buildings, attic, bridges, hollow trees.

The identification of the Red Bat was confirmed through manual vetting of the recordings. The remaining species require additional manual vetting to confirm identifications with high certainty. The Silver-haired Bat is not thought to occur in the coastal plain during the summer, and is probably misidentified by Kaleidoscope.

Acoustic bat survey methods are biased toward the detection of species that 1) have louder calls, 2) forage closer to ground (near the detectors), and 3) forage in less cluttered areas (such as the edges of clearings). Species that specialize in foraging in cluttered forested areas (many *Myotis* species), or above the forest canopy, are usually under-represented in acoustic sampling. Thus, additional species are likely utilize the properties yet remain undetected.

In addition to acoustic sampling, bats were surveyed on Long Bay Marina and South Bay Cove using mist-nets on July 8, 2018. Three nets were placed along the forest road separating the two properties for one night. No bats were captured. However, bats obviously use the properties as demonstrated by the acoustic data, and additional mist-net surveys conducted that July successfully captured Eastern Red Bat, Evening Bat, Seminole Bat, and Southeastern *Myotis* on nearby conservation properties (within 1,500' to 6,000' away) managed by EcoVest.

It's worth noting that the captured Seminole Bat is acoustically indistinguishable from the Red Bat and may contribute many of the supposed Red Bat recordings collected in acoustic surveys on the properties. Many of the calls identified as Red Bat may actually represent two species instead of one.

Four-letter Code, Status, and Habitat Information

CODE	SCIENTIFIC NAME	COMMON NAME	G-RANK	S-RANK	LEGAL STATUS	SC SWAP PRIORITY	Habitat
CORA	<i>Corynorhinus rafinesquii</i>	Rafinesque's Big-eared Bat	G3/G 4	S2?	State Endangered	Highest	T-beam and I-beam bridges, abandoned buildings, old bunkers and tunnels, cavity trees, rock outcrops, mines, caves
EPFU	<i>Eptesicus fuscus</i>	Big Brown Bat	G5	SNR		Highest	buildings, cavity trees, under bridges and in bat boxes; forage in open fields or forest gaps
LABO	<i>Lasiurus borealis</i>	Red Bat	G5	SNR		Highest	thinned stands; roost on smaller branches or twigs, often in the hardwood tree canopy; may roost in leaf litter
LACI	<i>Lasiurus cinereus</i>	Hoary Bat	G5	S?		Highest	tree cavities, trunks, tree foliage, squirrel nests, and Spanish moss
LAIN	<i>Lasiurus intermedius</i>	Northern Yellow Bat	G4/G 5	S?	Of concern, State	Highest	forage over open areas such as fields, pastures, golf courses, marshes, and along lake and forest edges; roost in clumps of Spanish moss or under old palm fronds
LANO	<i>Lasionycteris noctivagans</i>	Silver-haired Bat	G5	SNR		Highest	roosts include tree cavities, under loose bark, rock crevices, under tree foliage, and occasionally in buildings, stacks of firewood, and bird boxes; forage over water
LASE	<i>Lasiurus seminolus</i>	Seminole Bat	G5	SNR		Highest	roost in large pines located near forested corridors; may roost in leaf litter
MYAU	<i>Myotis austroriparius</i>	Southeastern Bat	G3/G 4	S1	State Threatened	Highest	caves (including limestone sinks), mines, abandoned buildings, and large hollow trees; prefers to feed and roost over water

MYLE	<i>Myotis leibii</i>	Eastern Small-footed Myotis	G3	S1	State Threatened	Highest	caves, mines, abandoned buildings, rock crevices and shelters, and crevices within bridges in wooded areas
MYLU	<i>Myotis lucifugus</i>	Little Brown Bat	G5	S3?		Highest	buildings and picnic shelters, cavity trees, caves
MYSE	<i>Myotis septentrionalis</i>	Northern Long-eared Bat	G5	S4	Federally Threatened	Highest	crevices and cavities in dead or live-damaged trees, but they sometimes roost between loose bark and the bole of dead trees; forage in mature stands
NYHU	<i>Nycticeius humeralis</i>	Evening Bat	G5				bottomland forests, waterways, Roosts in hollow trees, loose bark, Spanish moss, under palm fronds, in buidings/ attics
PESU	<i>Perimyotis subflavus</i>	Tri-colored Bat	G5	SNR		Highest	abandoned mines and caves, bridges, buildings
TABR	<i>Tadarida brasillensis</i>	Brazilian Free-tailed Bat	G5				Use wide variety of foraging habitats. Day roosts: buildings, attic, bridges, hollow trees.

CONSERVATION
ECOLOGY LLC

Camera Trapping Surveys—I used baited camera traps to detect the presence of large- and medium size mammals. *Reconyx Hyperfire PC800* cameras were deployed at four locations on the properties during January 2017 and February 2018. Each camera was attached to a tree with a cable lock approximately 2' above the ground. A perforated can of tuna was nailed to a tree approximately 3'-6' in front of the camera as bait to attract carnivore species (bears, weasels, mink, skunk, etc.). Peanut butter and jelly were also used as bait to attract rodents (woodrats, rabbits). The resulting photographs were identified and processed using Camelot software (v1.4.5). Results are listed in the tables below and representative photographs are included in the photo-document.

Species detected on the camera traps were Bobcat, Opossum, Raccoon, Grey Squirrel, White-tailed Deer, and Eastern Woodrat. Given their range size, abundance, and habitat requirements, all mammal species detected on camera traps are likely to occur across all four properties.

The Eastern Woodrat (*Neotoma floridana haematorea*) is a State Concern Species, is considered State Vulnerable (S3/S4), and is a SC SWAP Moderate Priority Species. Eastern woodrats are found within a variety of habitats, particularly mesic scrub thickets, deciduous forests, and hardwood pine forests within the coastal plain. Multiple photographs of the Eastern Woodrat were collected at CAM032 on the boundary between Cypress Cove and Long Bay within the pine plantation forest, which has a deciduous understory. In addition to the camera trap detections, woodrat middens were photographed at two locations on the South Bay Cove property (see photo-document).

Camera Trapping Results - Summary
Cypress Cove/Long Bay/North Bay/South Bay Properties
January 2017 & February 2018

Species	Number of Trap Stations Detected	Number of Photos	Independent Observations (>20 mins between trigger events)	Nocturnal (%)	Nights Elapsed	Abundance Index
Virginia Opossum	3	887	38	92.11	27	140.7
Common Raccoon	3	1761	20	100	27	74.1
White-tailed Deer	1	105	6	100	27	22.2
Eastern Gray Squirrel	2	8	2	0	27	7.4
Bobcat	1	30	1	0	27	3.7
Eastern Woodrat	1	10	1	100	27	3.7

	Common raccoon

Herpetiles-

Southern Toad, Eastern Box Turtle, Eastern Glass Lizard, and Green Anole were encountered during field visits. The Eastern Box Turtle (*Terrapene carolina*) is a Moderate Priority Species under the SC SWAP. The box turtle prefers moist woodlands with sandy or loamy soils in the open for egg laying, as well as loose soils and leaf litter for burrowing. It was observed on the boundary between South Bay Cove and North Bay Cove properties, and likely occurs throughout all four properties.

Wildlife Species Observed During Surveys - 2016/ 2017/2018
